

Change the project from your coding test:

- add `<build>` section to the `pom.xml`
- configure *maven-assembly-plugin* for assembling “fat.jar” – a jar with all libraries.

If properly configured maven will assemble `filename-jar-with-dependencies.jar` during the *package* phase.

To verify your solution, run in the terminal:

```
>> mvn clean package
```

and check that *jar-with-dependencies* appeared in *target* directory.

Run your application by the command in the terminal:

```
>> java -cp target/filename-jar-with-dependencies.jar path.to.Main
```

* read about *obfuscation* and obfuscate your jar during *package* phase.

Tip: use proguard and maven plugin for proguard
